## Data Engineering

Business Transformation and Change

## Adding the value of practical knowledge

Our consultants ensure you derive maximum benefit from information available in your enterprise architecture. We advise on infrastructure and data warehouse design to meet your full informational and governance needs.

Taking account of process analysis, end-user report generation, and detailed enterprise architecture analysis, we add value by improving data quality and thus the accuracy of your management information.

Our team of (re)insurance industry practitioners has extensive hands-on experience of managing portfolios. So we understand the importance of timely, accurate, complete and relevant information – as well as the issues and practicalities that can sometimes impact data quality.

We have a strong track record in resolving data-quality issues efficiently and effectively, leading to improved transparency of information and in-house knowledge.

We recognise the importance of understanding the root cause of a problem and where it may be practical to eliminate or work around an issue. With an objective external perspective, we focus on facts and solutions.

By focusing on the outcome and application of information, we avoid unnecessary wastage and over-engineering and deliver practical solutions.

## Why Pro?

Clients repeatedly turn to Pro because they know we have the expertise and specialist business focus to bring change projects to a successful conclusion.

They value our independence and integrity, the calibre of our staff, and our flexible pragmatic approach. They trust us to deliver dependable and competitively priced solutions backed by appropriate technology. They know our team of (re) insurance, finance and change management professionals have the skills to move their businesses seamlessly forward.

### Case study -

A major global reinsurer brought us in to create from scratch an outwards retrocession reporting platform to support a \$15 billion asset gained from an acquisition.

We provided a full data engineering solution incorporating full analysis of reporting requirements, analysis of legacy system data, design of a data warehouse solution, documenting reconciliation strategies and conducted detailed data quality analysis.

The project was completed within the fixed deadline and training was provided to the business community in readiness for the roll out to the company.

## "Pro provided a vital bridge between the business and IT..."
